

DRIVELINE SYSTEMS OF GROUND VEHICLES THEORY AND DESIGN

Alexandr F. Andreev, Viachaslau I. Kabanau, Vladimir V. Vantsevich

Vladimir V. Vantsevich, Scientific and Engineering Editor
(248) 204-2589 vantsevich@ltu.edu

Contents

1. Driveline systems and vehicle performance

- 1.1. Brief review of driveline systems history
- 1.2. Classification of driveline systems and power dividing units
- 1.3. Wheel dynamics and energy efficiency
 - 1.3.1. Five power modes of a wheel
 - 1.3.2. Kinematic and force factors of a wheel
 - 1.3.3. Wheel power and force balance
 - 1.3.4. Motion with a slip angle
- 1.4. Vehicle energy/fuel efficiency and driveline systems design
 - 1.4.1. Mechanical power loss in driveline systems
 - 1.4.2. Mechanical power loss in wheel systems
 - 1.4.3. Fuel efficiency of multi-wheel drive vehicles
- 1.5. Vehicle performance and driveline systems design
- 1.6. Principles of driveline system design

2. Interwheel and interaxle open and lockable differentials

- 2.1. Kinematics and dynamics of differentials. The gear-ratio concept
- 2.2. Kinematics of a vehicle with an interaxle differential
- 2.3. Tooth forces in bevel gear differentials
- 2.4. Robustness of differentials
- 2.5. Design of axle/interwheel differentials
 - 2.5.1. General technical issues and solutions
 - 2.5.2. Design of differential geometry
 - 2.5.3. Oil lubricant systems
- 2.6. Design of interaxle differentials and transfer cases
 - 2.6.1. General technical issues and solutions
 - 2.6.2. Design of differential geometry
 - 2.6.3. Oil lubrication systems
 - 2.6.3.1. Lubrication systems for interaxle differentials of driving tandems
 - 2.6.3.2. Lubrication systems for transfer cases
- 2.7. Designing locking devices
- 2.8. Wheel power distributions and vehicle performance
 - 2.8.1. Vehicle generalized parameters and energy/fuel efficiency
 - 2.8.2. Vehicle tractive and velocity properties
 - 2.8.3. Vehicle turnability and stability of motion
- 2.9. Optimal and reasonable differential gear ratios. Control principles

3. Automatic and manual positively engaged power dividing units

- 3.1. Designs of power dividing units
- 3.2. Kinematic discrepancy and generalized vehicle parameters
 - 3.2.1. Vehicles with 4x4 wheel formula
 - 3.2.2. Vehicles with 2mx2n wheel formula
- 3.3. Wheel slips and circumferential wheel forces
 - 3.3.1. 4x4 vehicles
 - 3.3.2. 2mx2n vehicles
- 3.4. Wheel power distributions and vehicle energy/fuel efficiency
 - 3.4.1. Mechanical power losses in wheel system
 - 3.4.2. Mechanical power losses in driveline system

- 3.4.3. Combined power losses in driveline and wheel systems. Fuel consumption
- 3.5. Wheel power distribution and vehicle performance
 - 3.5.1. Vehicle tractive and velocity operational properties
 - 3.5.2. Vehicle turnability and stability of motion
- 3.6. Optimal and reasonable kinematical discrepancy. Control principles

4. Limited slip differentials

- 4.1. Torque biasing and locking performance
- 4.2. Disk differentials without additional lockers
- 4.3. Disk differentials with cam lockers
- 4.4. Disk differentials with V-lockers
- 4.5. Worm gear differentials
- 4.6. Cam differentials
- 4.7. Torque sensitive differentials
- 4.8. Speed sensitive differentials
- 4.9. Force fluctuation in disk differentials
- 4.10. Tractive performance and yaw moment of a driving axle
- 4.11. Asymmetrical interaxle differentials

5. Free-running differentials

- 5.1. Design and operating principles of free-running differentials
- 5.2. Applications of free-running differentials
- 5.3. Viscous clutches: operation and design aspects

6. Combined automated mechanical driveline systems

- 6.1. Vehicle operational properties
 - 6.1.1. Vehicles with steered wheels
 - 6.1.2. Articulated vehicles with steered wheels
- 6.2. A method of synthesizing driveline systems with optimal properties
- 6.3. Objective function analysis
- 6.4. Synthesis of the properties of interwheel power dividing units
- 6.5. Synthesis of the properties of interaxle power dividing units
- 6.6. Synthesis of the properties of interwheel and interaxle power dividing units
 - 6.6.1. The mathematical model of a vehicle
 - 6.6.2. Optimal properties

7. Mechatronic driveline systems

- 7.1. Simple, combined, and integrated driveline systems – brief overview
- 7.2. Wheel inverse dynamics and control
- 7.3. Pro-active assessment of terrain conditions
- 7.4. Kinematics and dynamics of mechanical subsystems
- 7.5. Design of simple and combined driveline systems
- 7.6. Design of integrated driveline systems
 - 7.6.1. Optimal power distribution and features of system
 - 7.6.2. Synthesis and implementation of a parallel control algorithm
- 7.7. Hybrid driveline systems
 - 7.7.1. Advanced hybrid-hydraulic driveline systems
 - 7.7.2. Design selection of kind and standard dimension of hydraulic units

8. Testing driveline systems and multi-drive wheel vehicles

- 8.1. Laboratory tests of locking performance
- 8.2. Laboratory tests of frictional devices
- 8.3. Laboratory tests of lubricant systems of differentials
- 8.4. 4x4 vehicle chassis dyno with individual wheel control
- 8.5. Field and road tests of wheeled vehicles

Technical Questions and Problems
